We deliver innovative, NIAP PP 3.0 certified switching solutions.

What Is New About Protection Profile For Peripheral Sharing Switch ver. 3.0?

PP 3.0 is focused on addressing the threats from unauthorized & untrusted peripheral devices.

1. Unauthorized peripheral device threats

Threats imposed by peripheral devices that should not be connected to the specific KVM port. All unauthorized devices will be rejected and ignored by the KVM when connected to the KVM port.

2. Authorized but untrusted peripheral device threats

Threats imposed by legitimate and authorized peripheral devices while being used with the KVM, as all standard authorized peripheral devices connected to the KVM may be untrusted. The KVM must protect against these threats by disabling the peripheral or disabling just the end points of the device which cause the threat.

Key differentiators between PP 2.1 and PP 3.0

- Audio Device Security
- Improve Security for Keyboard and Pointing Devices
- Device Tampering Prevention and Detection
- Opens certification to solutions with newer protocols and/ or solutions with a subset of switching functions
- Superior Protection for Display Devices
- Support for User Authentication Devices which allows the use of Smart Card Readers
- Securing the federal desktop to mitigate cyber security threats
- Providing Multiple Level Security with full situational awareness

Possible threats from unauthorized and untrusted peripheral devices
